

# GLOBAL WARMING, THE WORLD'S BIGGEST PROBLEM!!

By Claudia Burton

## What is global warming?

Unfortunately, plants and animals are becoming endangered because the earth's temperature is heating and they can't survive in warmer climates. Global warming causes sea levels to rise and ice caps to melt so polar bears can die out. The earth is surrounded by an atmosphere which protects the world.

## Atmosphere

Although the Atmosphere protects us we are destroying it by burning fossil fuels. Without the atmosphere the earth will be really hot so polar bears will die out or have little to live on.

## What can happen?

Although global warming doesn't seem too bad, it's destroying the earth by creating stormy weather and heating parts of the earth. This is a problem because some animals will have to move home or plants *will become endangered.*

## Summary

Stop global warming by using less electricity. Save the world before it's too late because every second of every day it's getting worse!!!
