GLOBAL WARMING

WHAT IS GLOBAL WARMING?

Unfortunately, global warming is destroying the earth. Global warming is a rise in temperature but also a rise in sea levels.

WHY IS GLOBAL WARMING BAD?

If global warming carries on, droughts could become more frequent because the sun will shine brightly. In the future weather could get stronger so houses could get destroyed, leaving poor people to suffer and die.

WHAT HAPPENS IF WE DON'T HELP

Some time soon, the earth will be destroyed, because there will be less trees so there won't be enough oxygen to go around and then we will die. The habitat that plants and animals are living in now, will not be able to cope with the rising temperature. They are not used to hotter or colder climate change so if the temperature rises plants and animals might die.

WHAT HAPPENS TO LAND, PLANTS AND ANIMALS

Unfortunately, gas from the factory's make the ice melt causing extinction to polar bears and penguins. When the ice melts sea levels will rise so floods will be more frequent.

SUMMARY

Help stop Global Warming by saving electricity or having a shower instead of a bath. These little things will make a big difference! STOP GLOBAL WARMING!!!
