

Global Warming

By Daniel Thomson

What is the ozone? What is happening to our world?

The ozone layer is like a giant coat wrapped around the world. We are making gases by using too much gas and electricity. These are going up in the air.

Because the earth is getting warmer icebergs are melting and creatures that live in the poles will need to find another home. Also sea levels are rising and peoples homes may become flooded, so they will have to

move. The weather is more powerful which may lead to storms, Tsunamis, and hurricanes.

What can we do?

People should stop using the car because when you are driving pollution is coming out from behind the car. Also to help stop global warming we could re-cycle instead of using the rubbish bin. It uses less energy because we don't have to make new things. Anything that stops global warming is good.

Summary

Try to reduce global warming by saving energy, so sea levels won't rise and flood peoples homes. What can we do to help?
