

Global warming a Challenge to face by Katie King

Introduction

Unfortunately animals and plants are becoming endangered because the earth is heating up and they can't survive.

Atmosphere

Although the atmosphere protects us. On the other hand carbon dioxide is making holes in the atmosphere, which is letting the sun cook us in heat.

What could happen? The earth will get hotter and some parts of the world might turn into dessert and the rest will turn into water. That will make it harder to grow trees and crops.

What people can do ?

People should cycle or walk instead of driving because it will cause less fossil fuel and it will slow global warming down. Also only use plugs when they are needed.

Summary This world is extremely special so we have to protect it from global warming. So if people love this planet they will stand up and make a change.
