GLOBAL WARMING

Global warming is a rise in temperature and also a rise in sea levels. Scientists are not sure how this happens but some think it is caused by pollution.

Greenhouse Gasses

Gas from pollution traps heat from the sun. Special gasses keep the earth warm but too much of that particular gas overheats the earth. Carbon dioxide combined with the oxygen adds up to our green house problem.

So what is the big deal?

The big deal is that sea levels are rising so in the future ,people will be living under water. If people don't increase global warming then some places on earth might turn into a desert and people will not be able to grow crops.

What can we do?

We need to use less power and gas. This is because the pollution from the power station is causing global warming for example people can take showers instead of baths but even better take short showers. Don't use heating, wrap up warm.

Help increase global warming by using less electricity or recycling. If we don't do this, people might be living under water whilst some might live on a desert and won't be able to grow crops.
