

Global Warming - A Big Threat

Global warming is a rise in temperature and also a rise in sea levels. Scientists don't know about how it happens but it's either natural, man-made or both.

Greenhouse gases

Gas from pollution traps heat from the sun. Special gases keep the earth warm but too much of that particular gas overheats the earth. That is partly causing global warming. Carbon dioxide combined with the oxygen that we all breath adds up to our greenhouse gas problem.

So What's The Big Deal?

The big deal is that sea levels are rising. In the future, people would be living in the water. If people stop global warming then some places on earth will turn into a massive dessert and people will not be able to grow crops.

What Can We Do?

People can take showers instead of baths but even better they can take short showers. Don't turn on the heating just wrap up warm. Wait until you've got lots of washing, because you'll save electricity.

Summary

Help the earth now and help the earth today! By helping the earth you will save lives! You can make a difference by doing little things at a time! **Do it or die!**
