# Global warming

Every second of every minute every day, global warming is happening, unfortunately it is making peoples planet hotter. Global warming is caused by the pollution which is making our earth warmer. It makes the temperature rise quite high. Sea levels may rise too. Animals may lose their homes just because of GLOBAL WARMING.

What will happen if global warming goes on?

Unfortunately there could be a extinction for animals if global warming continues. There could be killer heat waves, which are very dangerous to people, there could even be a climate change.

## The Ozone Layer

Sadly, there's a hole in the ozone. The ozone protects us from getting sunburnt. Ozone is produced naturally and is part of our atmosphere .

## Stopping global warming

You can reduce global warming by switching light bulbs, walking instead of driving and taking shorter showers. Please just try to use less pollution, that will help slow down global warming.

## Summary

Please slow down global warming. If you don't, your house maybe a place under the sea. So help!
