What is global warming?

Sadly in eighty years if global warming continues some of our house will be under water. Global warming is a rise in temperature on the earth due to people burning gas and oil.

What will happen if global warming goes on?

Scientists think if global warming goes on there could be lots more hurricanes destroying our homes and crops. Because the planet is getting hotter our weather pattern is changing and this is causing lots

What is the ozone layer?

The ozone layer is a part of the atmosphere which covers the earth so the sun can't burn us. Because the pollution that is causing global warming is making holes in the ozone layer, it is destroying the atmosphere.

How to reduce global warming?

We can all help to reduce global warming by using less energy. For example always turn your television off, never leave it on standby because it wastes energy.
