Global Warming

Unfortunately, plants and animals are becoming endangered because of global warming. Global warming is the rise in temperature of the earth's atmosphere which protects us.

Atmosphere

The atmosphere is made up of lots of layers, for example, the ozone layer. It is like a huge life jacket protecting the earth and keeping it safe from harm. But unfortunately, it doesn't protect us from global warming because the carbon dioxide is destroying it.

What could happen?

There are a lot of important changes that could happen if global warming gets worse, for example, sea levels could rise, some parts of the world could turn into desert and more. As some animals are specially adapted to particular climates, they may not have time to adapt.

What can you do?

There is no way we can stop global warming entirely, but we can reduce the rate of it by doing simple things like switch of lights, cycle or walk, don't drive, don't leave your TV On stand by and quite a few more.

So if there are that many things we can do to reduce the rate of global warming, and that many reasons to do it, then what are you waiting for ?!
